A Cycle

Our seasons are a cycle. A cycle is like a circle that happens in the same way over again.

Winter, spring, summer and autumn make up the cycle. Which one is your favourite?

Cycles repeat over-and-over again.

The leaves are colourful in autumn.

The Four Seasons

Many places have four seasons. Colder winters are followed by warm springs and hot summers.

Hot summers are followed by cool autumns and cold winters. And then the cycle continues!

The places closest to the Sun tend to have two seasons.

The seasons occur across one year.

The Tilt

Do you know why the seasons are always changing? It's because the Earth is tilted.

When where you live is closer to the Sun, you get warm seasons. When where you live is far from the Sun, you get colder seasons.

It's important that the planet tilts.

In places closest to the Sun, it is always hot.

Conclusion

The planet is always moving so the seasons are always changing.

We are lucky to have seasons and share this crazy, tilted planet.

The movement helps create night and day, too.

What is your favourite season?
